

# Inclinometers

**For static applications**  
1- and 2-axis, metal housing

IN88

Fieldbus

The inclinometers of the IN88 series allow measuring 2-axis inclinations in the range of  $\pm 85^\circ$  or 1-axis inclinations up to  $360^\circ$ .

With their high robustness, their protection level up to max. IP69k and their wide temperature range from  $-40^\circ\text{C}$  to  $+85^\circ\text{C}$ , these devices are ideally suitable for outdoor use – e.g. for mobile automation applications.

## Features and benefits

- For different fieldbus systems**  
Variants for CANopen, SAEJ1939 or Modbus
- Individual settings via the fieldbus interface**
  - Define preset (zero point / midpoint position)
  - Setting the sensor filter
  - Resetting to factory settings
- Redundant measurement**  
The housing offers the option of mounting sensors in stacks in order to easily implement redundant measurement in the application.

- Simple start-up and diagnostics**
  - LED display for quick and visual detection of the operating status.
  - Optimum integration and loop-through in bus networks thanks to 2x M12 connector options
- Precise measurement even under harsh environmental conditions**
  - Temperature range  $-40^\circ\text{C} \dots +85^\circ\text{C}$  and protection class IP68 / IP69k
  - Protection against the influence of salt spray and rapid temperature changes
  - E1-approval
- Maximum robustness**  
The robust metal housing also protects the electronics from extreme mechanical influences.

## Interface characteristics CANopen

### General information on CANopen

The CANopen inclinometers support the latest CANopen communications profile according to DS301. In addition, device-specific profiles such as the inclinometer profile DS410 and DS305 (LSS) are available.

The following operating modes may be selected: Polled Mode, Cyclic Mode, Sync Mode. Moreover, scale factors, preset values and many other additional parameters can be programmed via the CAN bus. When switching the appliance on, all parameters are loaded from a flash memory. These parameters have previously been stored in a zero-voltage secure manner. The output values **position, position raw value, sensor temperature and sensor information** can be combined very variably as a PDO (PDO mapping). The inclinometers are available with one or two connectors.

The device address and baud rate can be set/modified by means of the software.

The two-color LED indicates the operating or fault status of the CAN bus, as well as the status of the internal diagnostics.

### LSS layer setting services DS305 V2.2

- Global command support for node address and baud rate configuration.
- Selective protocol via identity object (1018h).

### CANopen communication profile DS301 V4.2

Among others, the following functionality is integrated (Class C2 functionality):

- NMT slave.
- Heartbeat protocol.
- Identity object.
- Error behavior object.
- Variable PDO mapping, 2 sending PDO's.
- Node address, baud rate and programmable CANbus termination.

### Characteristics CANopen

<b>Interface</b>	CAN high-speed acc. to ISO 11898, Basic- and Full-CAN CAN specification 2.0 B
<b>Protocol</b>	CANopen profile DS410 V1.3 with manufacturer-specific add-ons, communication profile DS301 V4.2
<b>Baud rate</b>	10 kbit/s, 20 kbit/s, 50 kbit/s, 125 kbit/s, 250 kbit/s, 500 kbit/s, 800 kbit/s, 1 Mbit/s software configurable
<b>Node address</b>	1 ... 127 software configurable
<b>Termination switchable</b>	software configurable
<b>LSS protocol</b>	DS305 layer setting services 2.2

### CANopen Inclinometer profile DS410 V1.3

The following parameters can be programmed:

- Variable PDO mapping of position, position raw value, sensor temperature and sensor information.
- Extended failure management.
- User interface with visual display of bus and failure status - 1 LED two-color.
- Customer-specific protocol.
- "Watchdog controlled" device.

**Fieldbus / SAEJ1939**

## Interface characteristics SAE J1939

### General information concerning SAE J1939

The protocol J1939 originates from the international Society of Automotive Engineers (SAE) and operates on the physical layer with high speed CAN as per ISO11898. The application emphasis lies in the area of the power train and chassis of commercial vehicles. It serves to transfer diagnostic data (for example, motor speed, position, temperature) and control information. The inclinometers IN88 support the total functionality of J1939.

This protocol is a multimaster system with decentralized network management that does not involve channel-based communication.

It supports up to 254 logic nodes and 30 physical control devices per segment. The information is described as parameters (signals) and combined on 4 memory pages (data pages) into parameter groups (PGs). Each parameter group can be identified via a unique number, the parameter group number (PGN). Independently of this, each signal is assigned a unique SPN (suspect parameter number).

The major part of the communication occurs cyclically and can be received by all control devices without the explicit request for data (Broadcast). Furthermore the parameter groups are optimized to a length of 8 data bytes. This enables very efficient utilization of the CAN protocol. If greater amounts of data need to be transferred, then transport protocols (TP) can be used: BAM (broadcast announce message) and CMDT (connection mode data transfer). With BAM TP the transfer of data occurs as a broadcast.

### Inclinometer implementation SAE J1939

- PGNs that are adaptable to the customer's application.
- Resolution of address conflicts -> Address Claiming (ACL).
- Continuous checking whether control addresses have been assigned twice within a network.
- Change of control device addresses during run-time.
- Unique identification of a control device with the help of a name that is unique worldwide. This name serves to identify the functionality of a control device in the network.
- Predefined PGs for position, speed and alarm.
- 250 kbit/s, 29 bit identifier.
- Watchdog controlled device.

A two-color LED signals the operating and fault status of the SAE J1939 protocol, as well as the status of the internal diagnostics.

## Technology in detail

### Position angulaire exacte grâce à la mesure de l'accélération

#### Mesure de l'accélération

Dans la cellule de mesure d'accélération, la position angulaire absolue par rapport à l'accélération de la pesanteur  $\vec{g}$  est déterminée de manière capacitive..

Le déplacement **2** d'une masse d'essai **1** modifie la distance et donc la capacité **F** entre les électrodes fixes **3** et électrodes mobiles **4** dans la cellule de mesure. Cette capacité mesurée est en relation directe avec l'inclinaison du capteur.

#### Optimisation de la mesure grâce aux fonctions de filtrage

L'inertie de la masse d'essai, notamment en cas de rotation rapide ou de changement rapide de rotation ainsi que de vibrations, peut entraîner des imprécisions dans les données de mesure **b** saisies par rapport au mouvement réel **a**. Pour compenser ces effets indésirables, différents filtres **c** + **d** peuvent être paramétrés dans le inclinomètre.

#### Restrictions dues aux filtres

Cependant, cela entraîne un délai ( $\Delta t_c + \Delta t_d$ ) pour la sortie du résultat de la mesure (plus la mesure souhaitée est précise, plus le délai est important).

#### Optimisation supplémentaire grâce aux inclinomètres dynamiques

Pour de nombreuses applications statiques (comme les panneaux solaires, les mâts de grue...), ce délai n'est pas important. Mais pour les applications dynamiques (comme les véhicules en mouvement), cela peut poser des problèmes, car la réaction au mouvement peut également être retardée. Il est alors recommandé d'utiliser un inclinomètre dynamique IN72 avec fusion intelligente des capteurs de Kubler afin d'optimiser encore davantage le résultat de mesure.
